7. Conclusion on report

### **Influence of bioresonance impact exercised by the devices BIOMEDIS and BIOMEDIS-M on lifetime reactions of human cells**

#### 1. General considerations

Research on human cells and sign-variable electric field allows determining their reactions to different factors (A. A. Soloviev, 2011).

Presence of electric charge in molecules and macromolecular complexes makes a cell a complicated electric scheme. Many structures of cell have ability either to create oscillating waves or respond resonantly to external electromagnetic impacts. This ability changes during lifetime of cell. Pathological processes can change bioelectric parameters of cell specifically. That's why there is a possibility to develop algorithms of correction of cell's parameters in view of deviation's specific.

Analysis of deviations in human body and algorithms of their correction have been successfully developed with the help of creation of the portative devices

Deta-Ritm and Deta-AP. Many years of research and clinical trials have provided success.

The purpose of the work has been following: evaluation of effectiveness of developed methods of electromagnetic stimulation, considering reactions of human cells.

This problem has been solved with the help of an original method through usage of microelectrophoresis (MEP) (Soloviev A. A., etc. 2001).

The method has been introduced into practical health care (G. I. Cozinets, 1998, T. L. Redinova, N. P. Dmitracova, A. S. Yapeev, A. A. Soloviev, etc., 2004, F. C. Tetelyutina, S. N. Styajkina, N. A. Rebro, 2008, Soloviev A. A., etc. 2005).

The basis of the method related to usage of living cells' capacities is support of charge (S. S. Haramonenco, A. A. Rakityanskaya, 1979). The charge changes, when functional states of cells and body vary (S. A. Gonyan, 1992); the charge also reflects age-specific features of the body (V. G. Shachbazov, G. V. Colupaeva, 1987). The charge of cell reduces essentially in case of endotoxycosis (A. A. Soloviev, etc., 2005), and increases in case of malignant tumors (S. S. Haramonenco, A. A. Ralityanskaya, 1978).

Our work has contained the following tasks:

- to determine effectiveness of the used methods with the help of the device Biomedis and Biomedis-M, considering reactions of living cells;
- to determine level of offered methods' specific while influencing on various types of cells.

## 2. Materials and methods of research

Blood of 16 patients of various ages and sex, having acute pneumonia, has been studied. The following programs of the devices Biomedis have been utilized during the examination of the blood: "Erythrocytes", "Leukocytes", and "Deep cleaning". Bioplates with bronchi carcinomas have been studied in 14 patients with malignant tumors. Bioplates have been processed for further microelectrophoresis (MEP) with the help of the original method. The following treating programs of the devices have been used: "Cancer", and "Cancerogenic factor".

Blood cells and bioplates have been studied with the help of scientific complex "Cyto-Expert". Reactions of cells and video-programs have been analyzed by license computer programs NTC. Visual study of blood cells and bioplates has been conducted with the help of vital dyes.

## 3. Results

### Erythrocytes

Before usage of stimulation in intact blood of patients with pneumonia average rates of erythrocytes' activation were  $48 \pm 2,1\%$ , amplitude was  $2,7 \pm 0,3\mu\text{m}$ .

Because of usage of the program "Erythrocytes" the rates have become following:  $75,2 \pm 2,4\%$ ,  $4,2 \pm 0,4 \mu\text{m}$ .

Because of usage of the program "Deep cleaning" the rates have become following:  $63,8 \pm 3,2\%$ ,  $3,8 \pm 0,6 \mu\text{m}$ .

**Part 1. Processing options**

Pixel size: 0,500  $\mu\text{m}$

Radius of objects: 5pixels

First snapshot of processing: 0

Last snapshot of processing: 130

Processed through snapshots: 1

## **Part 2. Estimated statistical parameters of sampling of objects' oscillating amplitudes**

Total amount of objects: 2043

Adhering objects of total amount: 43 (2,10%)

Objects with torsion of total amount: 0 (0,00%)

Objects with rupture of total amount: 131 (64,22%)

Objects which are suitable for processing: 688

Number of unmoving objects of those suitable for processing: 115

Percent of unmoving objects: 16,72%

Average amplitude of oscillations: 5,68  $\mu\text{m}$

Average deviation of amplitudes: 1,03  $\mu\text{m}$

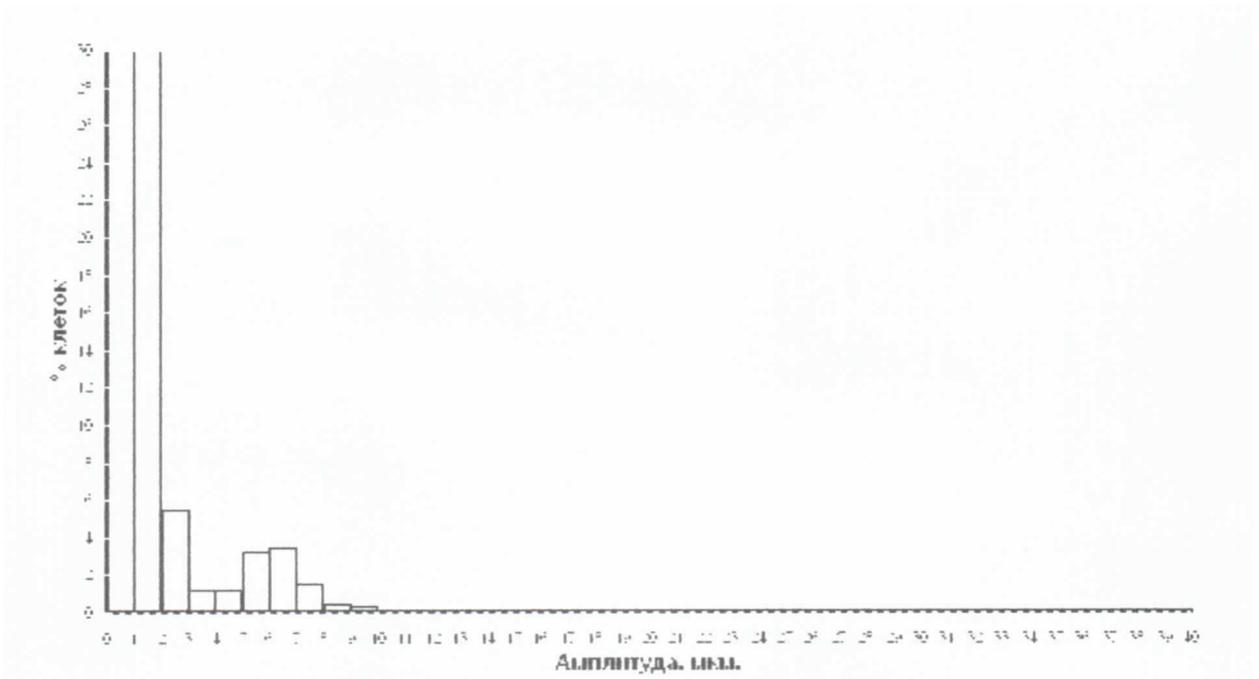

Asymmetry: 1,87

Outrage: 5,94

Average amount of fluid flow: 1,50  $\mu\text{m}$

Average deviation of fluid flow: 1,75  $\mu\text{m}$

## **Part 3. Graphics**

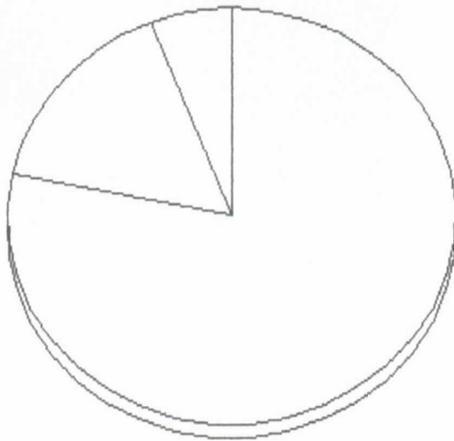

Amplitude,  $\mu\text{m}$

## **Influence of resonance impact on leukocytes**

If impact exercised by the program “Leukocytes” is absent, leukocytes in people with pneumonia don’t react to activity of electric field. When the program “Leukocytes” influences on blood, stimulation of leukocytes takes place during MEF. Amount of cells moving in electric field is equal to  $-39,4 \pm 2,9\%$  with amplitude comparable to amplitude of erythrocytes.

When the program “Deep cleaning” is used, percent of activated cells increases till  $46,7 \pm 3,2$ .

## **Studying of bronchi’s carcinomas**

It has been found that if the programs “Cancer” and “Cancerogenic factor” influence on selected malignant tumors’ cells, they cause stage degeneration of these cells. Processes of degenerations are typical for these programs; they last 15 minutes, ending with complete destruction of cells. At the beginning malignant cells become hyperchromic; then vacuolization of cytoplasm takes place. The process ends with fragmentation with destruction of cells.

## **4. Discussion of results**

Change of bioelectric features of cells is a result of their penetrability’s change and a result of transformation of ferment cascade’s cells.

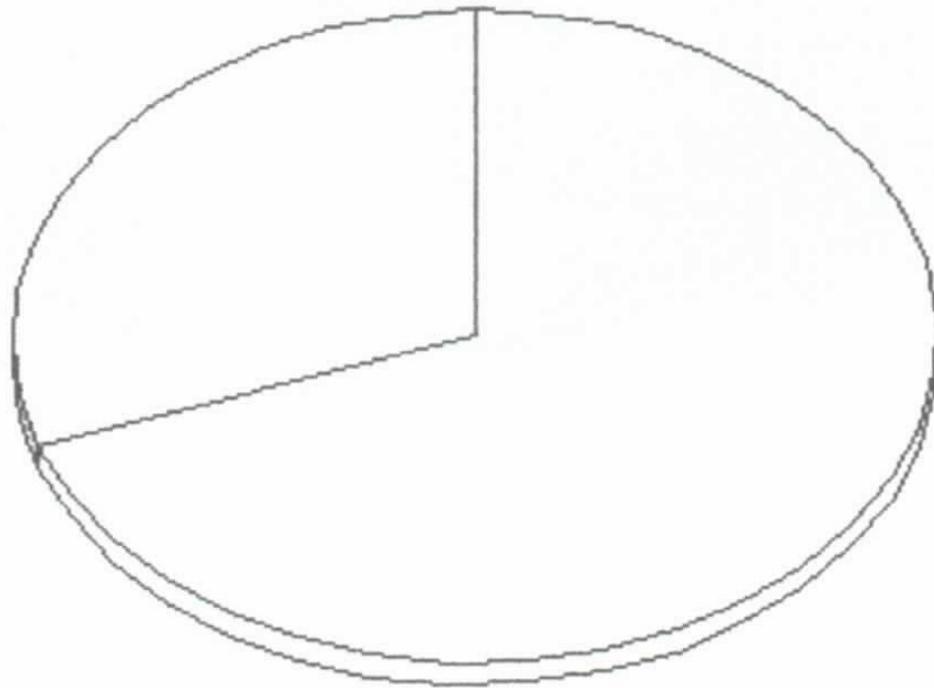

## **5. Conclusions**

The studied programs of BIOMEDIS’ devices are effective in case of corrective exposure on human cells. The effect of destructive impact of the programs

“Cancer” and “Cancerogenic factor” on malignant tumors’ cells of bronchi’s carcinomas is expressed clearly.

Organization: Izhevsk Medical Academy

Laboratory/Department of Histology

Goal of analysis: MEF

**REPORT ON RESULTS OF PROCESSING OF VIDEO RECORDING OF  
MEF AFTER ACTIVATION BY DEVICE BIOMEDIS-M**

**File: D:\NTU\WORKDIR\№2ERYTHROCYTES.mef**

**File of report: D:\=doc**

**Creation date: 14.01.14**

**Complex version: 3.2**

**Report version: 2.0**

## **1. Options of processing and statistic**

Sample size: 194

Confidence probability: 0,99

Pixel size: 0,49  $\mu\text{m}$

Frequency: 0,25 Hz

Intensity: 28,0 V

## **2. Statistical parameters of oscillating amplitudes of cells**

Percent of unmoving objects: 0,00%

Average amplitude of moving objects:  $6,25 \pm 0,77 \mu\text{m}$

Dispersion: 1,34 (0,65, 3,86)

Average quadratic deviation:  $0,16 \mu\text{m}$
